## 1 Audience And Goal

This guide is for developers who need to understand the application structure, local workflow, extension points, and delivery expectations.

## 2 Repository Layout

| Path                              | Responsibility                                                               |
|-----------------------------------|------------------------------------------------------------------------------|
| <code>app.py</code>               | Local Flask endpoint.                                                        |
| <code>portfolio.py</code>         | QuantLib market construction, trade pricing, and analytics logic.            |
| <code>tgir_quantlib_tools/</code> | Flask app construction.                                                      |
| <code>app_factory.py</code>       |                                                                              |
| <code>tgir_quantlib_tools/</code> | Route registration and HTTP handlers.                                        |
| <code>routes.py</code>            |                                                                              |
| <code>tgir_quantlib_tools/</code> | Session state, dashboard payload shaping, and trade-editor context building. |
| <code>dashboard.py</code>         |                                                                              |
| <code>tgir_quantlib_tools/</code> | Data-model page and research section context.                                |
| <code>quantlib_model.py</code>    |                                                                              |
| <code>tgir_quantlib_tools/</code> | Curated paper metadata for swaption and cliquet references.                  |
| <code>research.py</code>          |                                                                              |
| <code>templates/</code>           | Jinja templates for the UI.                                                  |
| <code>tests/</code>               | Smoke, calibration, and identity tests.                                      |
| <code>docs/latex/</code>          | Audience-specific LaTeX documentation.                                       |

## 3 Application Flow

1. `create_app()` loads configuration and builds the Flask app.
2. Authentication and template filters are registered.
3. Requests hit `tgir_quantlib_tools/routes.py`.
4. Protected routes load session state from `tgir_quantlib_tools/dashboard.py`.
5. Pricing functions in `portfolio.py` normalize state and construct QuantLib objects.
6. Templates render the final dashboard, editor, or model/research page.

## 4 State Model

The session state is a nested dictionary with:

- `market` for rates, swaption volatility, shared mean reversion, and SPX equity assumptions,
- `trades.swap`,
- `trades.european_swaption`,
- `trades.bermudan_swaption`, and

- `trades.bermudan_swaption_2`, and
- `trades.equity_cliquet`.

Always pass data through `normalize_portfolio_state()` before constructing pricing objects.

## 5 Pricing Responsibilities

### 5.1 `portfolio.py`

This is the core quantitative module. It owns:

- curve normalization and construction,
- swaption-volatility matrix normalization,
- swap, swaption, and cliquet instrument creation,
- European Hull-White 1F + Jamshidian pricing,
- Bermudan Hull-White 1F / G2++ calibration and tree pricing,
- price tables,
- risk ladders, and
- cliquet scenario and Monte Carlo analytics.

### 5.2 `dashboard.py`

This module should stay presentation-oriented. It shapes payloads, form definitions, and display-specific summaries, but should not duplicate pricing logic already available in `portfolio.py`.

## 6 How To Add Or Change A Trade

1. Extend `default_portfolio_state()` and normalization rules.
2. Add a human-readable entry in `TRADE_SEQUENCE` and `TRADE_TITLES`.
3. Implement instrument creation and pricing in `portfolio.py`.
4. Add form definitions and update handlers in `tgir_quantlib_tools/dashboard.py`.
5. Add template support in `templates/dashboard.html` and `templates/trade\_form.html`.
6. Extend smoke and regression tests before merging.

## 7 Local Development Workflow

### 7.1 Setup

```
python3 -m venv .venv
./venv/bin/python -m pip install -r requirements.txt
cp .env.example .env
```

## 7.2 Useful Commands

```
./venv/bin/python app.py
./venv/bin/python build_SOFR_curve.py
./venv/bin/python -m unittest discover -s tests
./venv/bin/python -m py_compile portfolio.py tgir_quantlib_tools/*.py
```

## 8 Documentation Workflow

The LaTeX docs are built with:

```
make -C docs/latex
```

Keep audience-specific material separated:

- end users: workflows and UI,
- quants: models and assumptions,
- developers: architecture and extension points,
- IT: runtime operations,
- testing: regression methodology,
- deployment: CI/CD and DigitalOcean procedures.

## 9 Testing Expectations

Changes that touch pricing must update tests in one of three layers:

- `tests/test\_sofr\_curve.py` for calibration or rates logic,
- `tests/test\_cliquet.py` for cliquet payoff identities, and
- `tests/test\_smoke.py` for route and rendering behavior.

## 10 Change Review Checklist

- Did the change preserve state normalization?
- Is new pricing logic in `portfolio.py` rather than duplicated in templates or routes?
- Do calibration instruments still reprice?
- Are tests deterministic?
- Are docs updated in both Markdown and LaTeX where relevant?
