Runtime Model

- Single Flask application.
- No database.
- Production target: Apache reverse proxy to local WSGI service.
- Local debug CSV output on disk.

Operational Inputs

- `FLASK_SECRET_KEY`
- `APP_LOGIN_USERNAME`
- `APP_LOGIN_PASSWORD` or hash
- host, port, and Apache proxy settings

Core Operational Checks

- Service status from systemd.
- `/health` endpoint.
- Apache access and error logs.
- Deployment workflow logs.

Security Focus

- Keep secrets out of Git.
- Force HTTPS in production.
- Restrict server access.
- Protect the `.env` file with filesystem permissions.

Recovery Model

- Preserve release directories and a current symlink.
- Back up the production `.env` and service configs.
- Roll back by repointing the symlink and restarting the service.
